                                                                                                                                                      Interaction. The hPSP DNA is useful for chromosome identification and isolation of the corresponding genomic DNA. The DNA and protein can be used to detect abnormal levels of hPSP (in standard blotting).

Consider the corresponding genomic DNA. The DNA and protein can be used to detect abnormal levels of hPSP (in standard blotting).

Consider the corresponding genomic DNA. The DNA and protein can be maplification or immuno assays), particularly for diagnosis of diagnosis of cancers of the saltwary gland, thymus and paperceas which are associated with high levels of hPSP. The protein is also useful as antifungal, antibecterial, antiperasitic and antiviral agents and may be expressed in vivo from the DNA. The protein, or cells expressing it, are used in screening tests to identify specific antigonists, e.g. antibodies (Ab), polypeptides and antisense nucleic acids, which are potentially useful for treating conditions associated in the excessive hPSP production. Cells containing the DNA are used to express the recombinant protein and this can be used to raise Ab useful for diagnosis, therapy, for affinity purification and to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Parotid secretory protein; human; cancer; autoimmune disease; secretory lissue; gastrointestinal tissue; HSPSP, Sjorgen's syndrome; Graves disease; thyroidilis; insulin-dependent diabetes; pancreatitis; ulcerative colitis; Crohn's disease; atrophic gastritis.

purification of HPSP from natural sources. Expression of HPSP may indicate cell proliferation. HPSP nucleic acid or its fragments are used to detect HPSP-encoding sequences (optionally after amplification by PCR) by hybridisation, particularly for diagnosis and monitoring of disease, but also for mapping the chromosomal sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This represents a human parotid secretory protein (HPSP). Antagonists that bind specifically to, and modulate activity of HPSP are used to treat cancer and autoimmune diseases particularly of secretory or gastrointestinal tissue, e.g. cancer of salivary gland, thyroid, prostate, breast, gastrointestinal tract or pancreas, Sjorgen's syndrome, Graves disease, thyroiditis, insulin-dependent diabetes, pancreatitis, ulcerative colitis, Crohn's disease and atrophic gastritis Host cells containing expression vectors comprising the HPSP nucleic acid are used to produce recombinant HPSP which is used to generate antibodies and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 DLGVLQKSSAWQLAKOKAQEAEKLLNNVISKLLPTNTDIFGLKISNSLILDVKAEPIDDG 120

PRO genes. Exemplary conditions or disorders to be treated with supplicing antibodies and other compounds include benign or malignant tumours colorectal, prostate, pancreatic, lung, vulva, thyroid, hepatic carcinomas, sarcomas, glioblastomas, and various head and neck tumours), leukaemias and lymphoid malignancies, other disorders such as neuronal, glial, astrocytal, hypothalamic and other qlandular, macrophagal, epithelial, stromal and blastocoelic disorders, and inflammatory, angiogenic and immunologic disorders. AAC5816 represent por primers and hybridisation probes used in the isolation of the human prosequences. AAC5836 to AAC5836 represent properties. AAC5836 to AAC5836 represent manner properties. AAC5806 of the human properties and hybridisation probes used in the isolation of the human properties. AAC5806 to AAC5806 represent human properties and protein sequences given in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes an isolated antibody that binds to one of the human PRO proteins designated PRO212, PRO290, PRO311, PRO535, PRO6199, PRO317, PRO809, PRO319, PRO8197, PRO1009, PRO1009, PRO1005, PRO1009, PRO1005, PRO1009, PRO1005, PRO1009, PRO1005, PRO1009, PRO1005, PRO1009, PRO1005, PRO1009, PRO2009, PRO2005, PRO319, PRO2005, PRO319, PRO2005, PRO319, PRO2005, PRO319, PRO2005, PRO319, PRO2005, PRO319, PRO3190, PRO3190

The invention relates to sequences AAARY125-AB774 which encode human secreted proteins AAB25763-B25812. The proteins include signal peptides. Included in the invention are a host cell containing one of the cDNA sequences, and a purified antibody capable of binding to one of the sequence data on a computer system, and a method for storing the sequence data on a computer system, and a method for identifying features of the CDNA sequences using a computer programme. The CDNAs are useful for expressing secreted proteins or fragments to obtain antibodies capable of specifically binding to the secreted

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ŏ
 AAM99166, to AAH99904 encode the human proteins given in AAM25225 to
AAM26363. The proteins can have activities based on the tissues and
cells they are expressed in, such as: antinflammatory; antinheumatic;
antiatrhritus; immunosuppressive; antibacterial; endocrine; cardiant;
central nervous system; virucide; anti-HVV; fungicide; antimutagen;
antidiabelic; oftendatological; antiallergic; antiasthmatic;
antidiabelic; oftendatic; neuroprotective; antidepressant; nootropic;
antidiabelic; softendatic; neuroprotective; antidepressant; nootropic;
antidiabelic; special and polynucleotides are useful for screening for agonists or antagonists of a protein and for the treatment and diagnosis, of disorders associated with the activity of a protein e.g. inflammation, neuropathology, cardiac anaphylaxis, viral, bacterial, HIV and fungal infections, autoimmunity, genetic diseases, haematopoletic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                           anaemia, platelet disorders, thrombocytopaenia, wounds, burns, ulcers, osteoporosis, severe combined immunodeficiency, eczemia, allergic rhinitis, asthma, diabetes, cancer, multiple sclerosis, depression, Alzheimer's disease, Parkinson's disease, neurodegenerative and

Human brain expressed single exon probe encoded protein SEQ ID NO: 34413.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; brain expressed exon; gene expression analysis; probe; microarray; Alzheimer's disease; multiple sclerosis; schizophrenia;

probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leuksemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide #9264 encoded by probe for measuring placental gene expression.
                                                      The present invention provides a number of single exon nucleic acid

treatment of mammalian diseases which is the properties of inappropriate of an appropriate of treatment, and as a serior properties of the differentiation of tissue specific cells. These proteins are important in the maintenance of tissue integrity and thus are important in wound healing. They are useful in various assays to determine the biological activity, to raise antibodies, to isolate corresponding interacting proteins or other compounds, to quantitatively determine levels of interacting proteins or other compounds, to quantitatively determine levels of interacting proteins or cher compounds, and as therapeutic target in a whole range of disease states. Compositions comprising the novel proteins of the invention are useful for treating mammalian disorders. Polynucleotides of the invention are useful in genome and physical mapping, in positional cloning of are useful in genome and physical mapping, in positional cloning of treatment of mammalian diseases which is the consequence of inappropriate corresponding immune response or treatment of an organism or its reproductive material (as non-disruptive tags for marking organisms), and for the diagnosis and treatment of an immunoregulatory and anti-inflammatory molecule, as a part of a vaccine or anti-cancer treatment, as immunoregulatory and anti-inflammatory molecule, as atti-cancer treatment, and as a target for antagonists in the treatment of diseases such as asthma and allergy. They are also useful to inhibit to remain the material manner of the invention, for tissue and neural regeneration, to promote or block the invention, to promote or block cell trafficking, and as anti-inflammatory and/or vaccine adjuvant.

The sequence is predicted from a full-length CDNA clone (see AAX59356) isolated from a human adult brain (thalamus) cDNA library. The invention provides cDNA clones (see AAX59352-58)

encoding novel secreted proteins (see AAY06404-10) of the human tests, brain and foetal kiddey. The polynucleotides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data are provided. Suggested activities include nutritional, cytokine, cell provided. Suggested activities include nutritional, cytokine, cell vaccine) or immunosuppressive, haematopoiesis regulating, tissue sprowth, activin or inhibin, chemotactic or chemokinetic, hammosuppressive, haematopoiesis regulating, tissue haemostatic, thrombolytic, receptor/ligand, antiinflammatory, cadherin or tumour invasion suppressor, and tumour inhibition

Sequences AAW95463-47] represent LSI70 polypeptide fragments which contain at least on epitope in their sequences. The present invention contain at least on epitope in their sequences. The present invention treating a test sample with at least one LSI70 specific nucleic acid that has at least 50 percent identity with any of the sequences (AAX00801-09) and the are fragments derived from various clones of LSI70 gene. The LSI70 coulding acid fragments represent a set of configuous, partially contained in a sequences (AAX00801-09) and disease. Specifically cancer, and to indicate predisposition to such disease. Particularly detection of LSI70 polynucleotide. ISI70 antibodies is indicative of disease. Cells cantigened with an expression system comprising the LSI70 nucleic acid are used to express recombinant polypeptides. The polypeptides can be used to raise Ab and for drug screening. LSI70 related nucleic acid are says. as targets for drug screening. LSI70 related nucleic acid assays; as targets for drug screening, and as components or largets for the many, e.g. as antisense, ribozyme or triplex.forming apents in the contains and reagents in the largets.
                                                                                                                                                                                                                                                                                                                                                           therapy, e.g. as antisense, ribbzyme for triplax-forming agents, lower therapeutic agents to LS170-expressing cells; directly competitive binding drug screens, and to generate anti-idiotypic antibodies for use in rational drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9

                                                                                                                                                                                                                                                                                                                                                The present sequence is encoded by a lung specific gene, designated Lug110, clone ID 1355520, gene ID 236760. The specification describes methods for diagnosing the presence of lung cancer in a patient. The method comprises measuring levels of lung specific genes in cells, tissues or bodily fluids, and comparing the level to that of a normal human control. The methods can be used for diagnosing, monitoring, staging or prognosticating lung cancer. Sepecially metastatic lung cancer. Antibodies against proteins encoded by lung specific genes can be used for imaging or, when conjugated to a cytotoxic agent, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               132 NVTVAGPIIG-QIINLKASLDLLTAVTIETDPQTHQPVAVLGECASDPTSISLSLLDKHS 190

impunodeficiency (SCID), autoimmune disorders e.g. multiple sclerosis, systemic lupus erythematosus, rheumatoid arthritis, autoimmune pulmonary inflammation. The proteins are also useful in the treatment of diseases and disorders including tissue, skin and organ transplantation and in graft-versus-host diseases (GVHD), in the induction of tumour immunity, myeloid or lymphoid cell deficiencies, wound healing and tissue repair, in the treatment of burns, incisions and ulcers; as well as in treatment of periodontal disease, osteoporosis or osteoparthritis, mediated by inflammatory processes, diseases of the peripheral nervous system, anylotrophic lateral sclerosis, and Shy-Drager syndrome, infections, infarction of cardiac and central nervous system vessel e.g. stroke, infarction of cardiac and central nervous system vessel e.g. stroke, septim activin- or inhibin related activities is useful as a contraceptive based on the ability of inhibins to decrease fertility in the manmals and decrease spermatogenesis in male ammunals and decrease spermatogenesis in manmals. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to novel human secreted proteins, the nucleic acids encoding them. The protein may exhibit cytokine, cell proliferation or cell differentiation activity or may induce production of other cytokines in certain cell populations and may exhibit immune stimulating or immune suppressing activity, which is useful for the treatment of various immune deficiencies and disorders e.g. severe combined
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          78 kpgggtsggllggllgkvtsvipglnnildikvtdpqllelglvgspdghrlyvtiplgi 137

Fructose-bisphosphate aldolase class I (EC 4.1.2.13) (FBP aldolase).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Marke ..., usera, 175:7495-7499(1993).

-i Bacteriol. 175:7495-7499 (1993).

-i CATALYTIC ACTIVITY: D-fructose 1,6-bisphosphate - glycerone phosphate + D-glyceraldelyde 3-phosphate.

-i- PATHWAY: SIXYHI STEP IN GLYCOLYSIS.

-i- SIMPLARITY: BELONGS TO CLASS I FRUCTOSE-BISPHOYPHATE ALDOLASE
